How to Write Great Papers From title to references From submission to acceptance

Presented by: Anthony Newman, Executive Publisher, Elsevier Jan-Albert Majoor, Account Development Manager, Elsevier

Location/Date: France June 2013

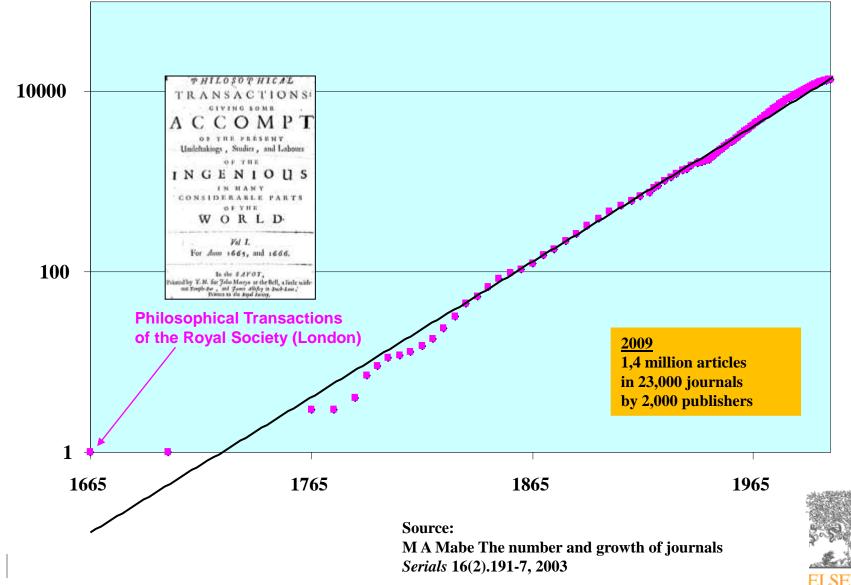

Workshop Outline

How to get Published

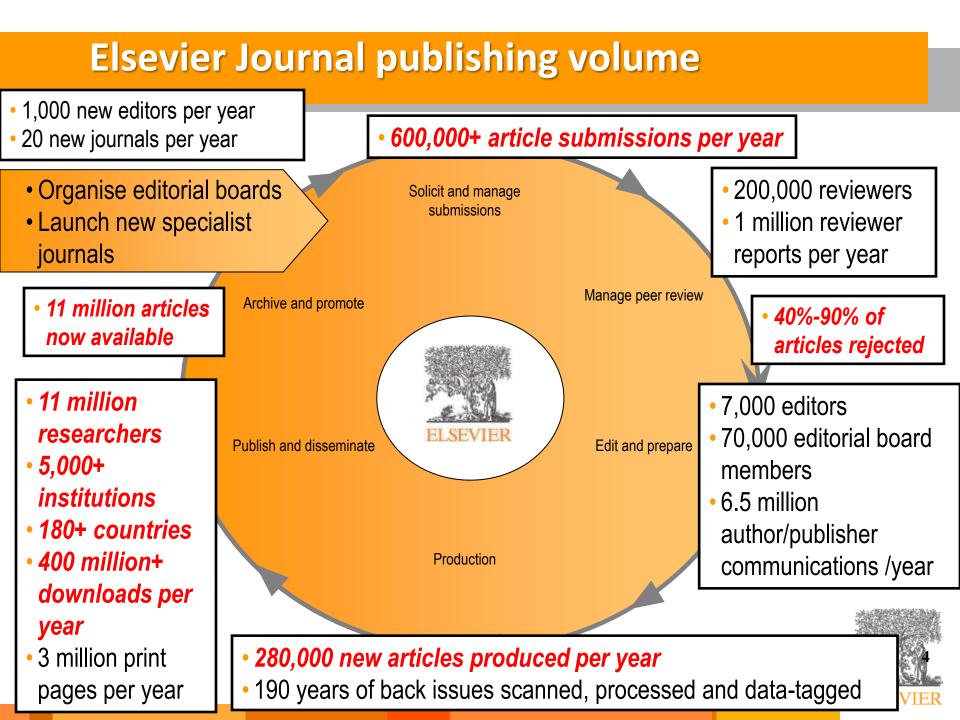

- Before you begin
- Select your audience
- The article structure
- The review and editorial process
- What not to do... (author ethics)

Peer – Reviewed Journal Growth 1665-2001

3

Trends in publishing

Rapid conversion from "print" to "electronic"

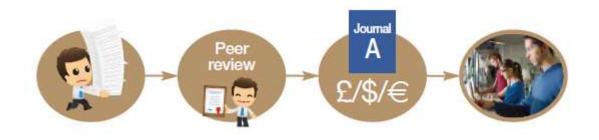

- 1997: print only
- 2009: 55% e-only (mostly e-collections) 25% print only 20% print-plus-electronic
- 2012: 95+% e-only
- Changing role of "journals" due to e-access
- Increased usage of articles
 - at lower cost per article
- Electronic submission
 - Increased manuscript inflow
- Experimentation with new publishing models
 - E.g. "author pays" models, "delayed open access", etc.

Open Access

Gold Open Access

Gold Open Access

- After acceptance, research is made immediately, permanently open access
- Readers can copy and reuse the content as defined by user licenses.
- Costs are covered by a open access publication fee
- Some funding bodies & institutions will reimburse authors for such fees.

Benefits of Gold

- Immediate open access
- You can choose your user license
- Authors retain copyright
- Share the final published article

Green Open Access

Green Open Access

- After publication and acceptance in a subscription journal author publish in a journal
- The article is immediately available to subscribers
- After a delayed period of time (an embargo) authors can post their manuscript to an institutional repository for public use
- Applies to the accepted author manuscript and preprint versions
- Cost of publication are covered and dependent on the subscription model.

Tips for publishing Gold Open Access?

Complying with new polices

Three key funder developments:

Research Councils UK

European Commission - Horizon 2020

Every EU country to develop their own policy

•Office of Science and Technology Policy (US)

0 Office of Science and Technology Policy

Publishing with Open Access

Our Open Access Options include:

- Open Access Journals
- Open Access Articles
- Open Archive

- Elsevier's open access publication fees are market based & provide competitive prices which range from 500-5000 USD.
- Offer authors a choice of user licenses, including Creative Commons.
- Developed a number of institutional and funding body agreements to help streamline processes and manage open access policies.

Open Access Journals

Open Access Journals

Open Access Articles

Open Archive

A journal where all articles are freely available to all with permitted re-use.

- Maintains rigorous peer review
- No subscription charges
- Exclusive license agreement
- Choice of user licenses
- Open access publication fee

Elsevier publishes over 38 Open Access Journals

and still adding more..

Open Access Articles

Open Access Journals

Open Access Articles

Open Archive

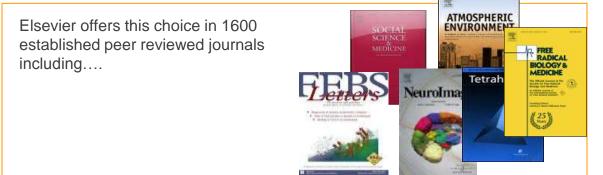

Subscription journal which offers and open access option. Open Access articles are freely available to subscribers and the general public with permitted re-use.

- Allows authors to publish open access in high quality, indexed journals
- Maintains rigorous peer review
- Exclusive license agreement
- Choice of user licenses

What are they?

• Open access publication fee

Open Archive

Open Access Journals

Open Access Articles

Open Archive

What are they ?

Articles which are made open access after an embargo period. These articles are freely available to subscribers and the general public with permitted re-use.

- Length of embargo period is journal specific
 - Provides free access to archived material

Elsevier has 82 journals that feature Open Archives

Your personal reason for publishing

 However, editors, reviewers, and the research community don't consider these reasons when assessing your work.

Always keep in mind that ...

.... your published papers, as a permanent record of your research, are your passport to your community !

Why publish?

Publishing is one of the necessary steps **embedded in the** scientific **research process**. It is also necessary for graduation and career progression.

What to publish:

- New and original results or methods
- **Reviews or summaries of** particular subject
- Manuscripts that advance the knowledge and understanding in a certain scientific field

What NOT to **publish**:

- Reports of no scientific interest
- Out of date work
- **Duplications** of previously published work
- Incorrect/unacceptable conclusions

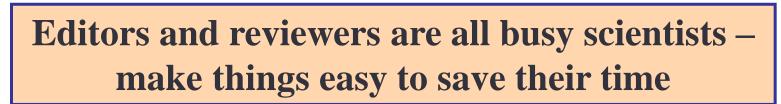

You need a **STRONG** manuscript to present your contributions to the scientific community

What is a strong manuscript?

- Has a <u>novel</u>, <u>clear</u>, <u>useful</u>, and <u>exciting</u> message
- Presented and constructed in a <u>logical</u> manner
- Reviewers and editors can grasp the scientific significance <u>easily</u>

How do I look? ORCID: Author Profile 2.0

ORCID Connecting Research

and Researchers

- Open
- Researcher &
- Contributor

The Challenge:

- The scholarly record is broken
- Name ambiguity is an issue

The Solution:

• Establish a researcher identifier registry (partnership between Univs, Publishers, funding bodies...)!

The Benefits:

- Current authors can claim already published work
- New authors can establish unique identifier

• ID

26

ORCID Launches Registry October 16, 2012

ORCID (Open Researcher and Contributor ID) is excited to announce the launch of its Registry (http://orcid.org), where researchers can distinguish themselves by creating a unique personal identifier.

Launched 16 October 2012

"ORCID addresses a problem shared by individuals and organizations across the research community: reliably connecting research with researchers," said Laure Haak, Executive Director of...

Evaluate which journal is right for your manuscript What is the Impact Factor (IF)?

Impact Factor

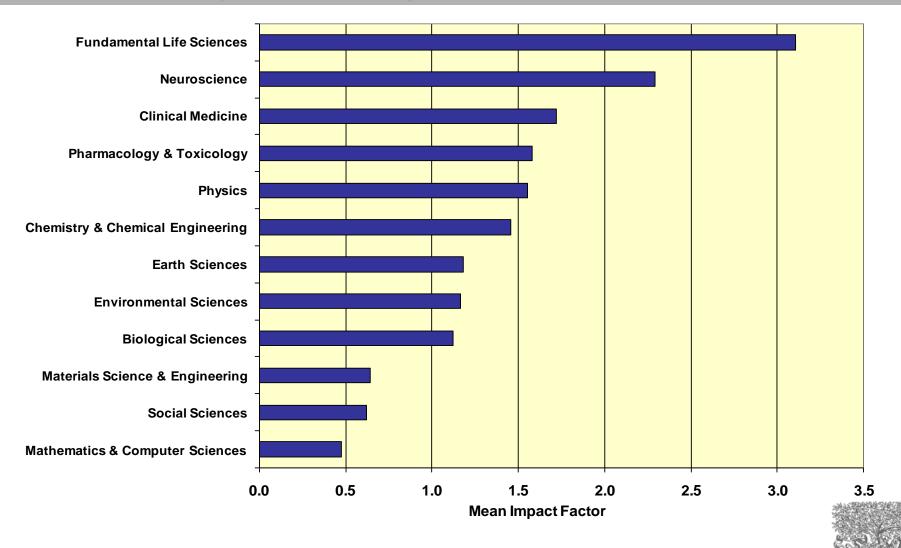

[the average annual number of citations per article published]

- For example, the 2011 impact factor for a journal is calculated as follows:
 - A = the number of times articles published in 2009 and 2010 were cited in indexed journals during 2011
 - B = the number of "citable items" (usually articles, reviews, proceedings or notes; not editorials and letters-to-the-Editor) published in 2009 and 2010
 - 2011 impact factor = A/B
 - e.g. <u>600 citations</u> = 2.000
 150 + 150 articles

Evaluate which journal is right for your manuscript Influences on Impact Factors: Subject Area

29

Use the research tools available – be strategic!

- Find out what is being downloaded.
- Find out what is being cited.
- Find out who is being cited.
- Check what research is about to be published.
- If asked to collaborate check them out.

Use Strategy as well as Science

Questions to answer before you write

Think about WHY you want to publish your work.

- Is it new and interesting?
- Is it a current hot topic?
- Have you provided solutions to some difficult problems?
- Are you **ready** to publish at this point?

If <u>all</u> answers are "yes", then start preparations for your manuscript

What type of manuscript?

- Full articles/Original articles;
- Letters/Rapid Communications/Short communications;
- Review papers/perspectives;

Self-evaluate your work: Is it sufficient for a full article? Or are your results so thrilling that they need to be shown as soon as possible?

Ask your supervisor and colleagues for advice on manuscript type. Sometimes outsiders see things more clearly than you.

Select the best journal for submission

- Look at your references these will help you narrow your choices.
- **Review** recent publications in **each candidate journal**. Find out the hot topics, the accepted types of articles, etc.
- Ask yourself the following questions:
 - Is the journal peer-reviewed?
 - Who is this journal's audience?
 - What is the journal's Impact Factor?
- DO NOT gamble by submitting your manuscript to more than one journal at a time.
 - International ethics standards prohibit multiple/simultaneous submissions, and editors DO find out! (Trust us, they DO!)

Identify the right audience for your paper

 Identify the sector of readership/community for which a paper is meant

- Identify the interest of your audience
- Is your paper of local or international interest

BCP Special Issues: Published and Future issues

Danuary 2008 Addictions Special Issue Edited by David Weinshenker

Description

Biochemical Pharmacology is an international journal devoted to publishing original work on the interaction of drugs and nontherapeutic xenobiotics with biological systems. While particular emphasis is placed on reporting findings that relate to the actions and metabolism of drugs and toxic substances at the biochemical and molecular levels, submissions in the areas of behavioral and physiological pharmacology and toxicology are also encouraged if they describe studies directed at defining mechanisms of action. All areas of the field are represented in the journal including, but not limited to, cancer chemotherapy, neuropharmacology, inflammation/immunopharmacology, antimicrobials, behavioral, respiratory, gastrointestinal, cardiovascular, and endocrine pharmacology and toxicology. Submissions relating to either pharmacodynamics or pharmacokinetics are considered. Reports based on experiments conducted with mixtures, plant or animal extracts will not be considered for publication unless the chemical structures and concentrations of all substances are known. Submissions to the journal must be in English.

The journal publishes the following types of reports:

(1) Full-length Research Papers. These contain the results of original research on an issue of relevance to the field of pharmacology.

(2) Commentaries. These are commissioned articles that provide the author's view on a selected topic of

- Investigate all candidate journals to find out
 - Aims and scope
 - Accepted types of articles
 - Readership
 - Current hot topics
 - go through the abstracts of recent publications)

Tip: An international editor says...

"The following problems appear much too frequently"

- Submission of papers which are clearly out of scope
- Failure to format the paper according to the Guide for Authors
- Inappropriate (or no) suggested reviewers
- Inadequate response to reviewers
- Inadequate standard of English
- Resubmission of rejected manuscripts without revision

- Paul Haddad, Editor, Journal of Chromatography A

Guide for Authors

Artwork instructions

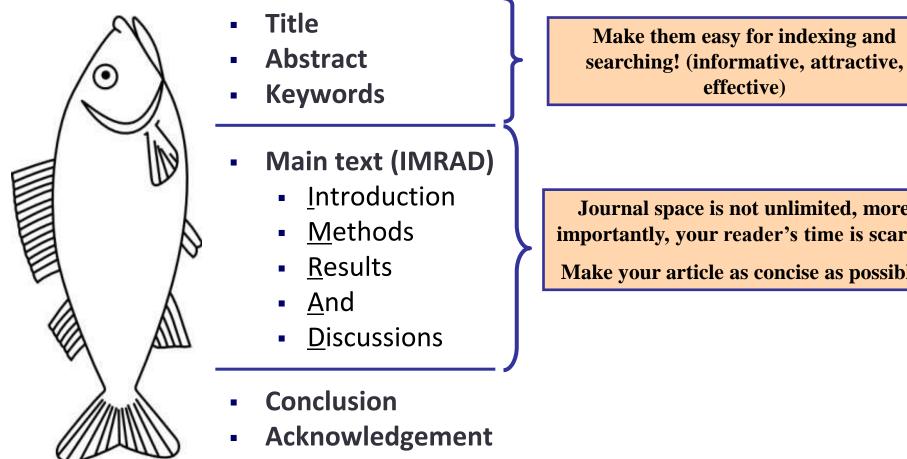

Authors Rights

Funding Bodies Compliand

- Keep to the Guide for Authors in your manuscript, even in the first draft (text layout, nomenclature, figures & tables, references etc.). In the end it will save you time, and also the editor's.
- Editors (and reviewers) do not like wasting time on poorly prepared manuscripts. It is a sign of disrespect.

Tip: General Structure of a Research Article

- References
- **Supplementary Data**

Journal space is not unlimited, more importantly, your reader's time is scarce.

Make your article as concise as possible.

Save your editor and reviewers the trouble of guessing what you mean

Complaint from an editor:

"[This] paper fell well below my threshold. I refuse to spend time <u>trying</u> <u>to understand</u> what the author is trying to say. Besides, I really want to send a message that they can't <u>submit garbage</u> to us and expect us to fix it. My rule of thumb is that if there are more than 6 grammatical errors in the abstract, then <u>I don't waste my time</u> carefully reading the rest."

Scientific Language – Overview

Write with clarity, objectivity, accuracy, and brevity.

- Key to successful scientific writing is to be alert for common errors:
 - Sentence construction
 - Incorrect tenses
 - Inaccurate grammar
 - Not using English

Check the <u>Guide for Authors</u> of the target journal for language specifications

Scientific Language – Sentences

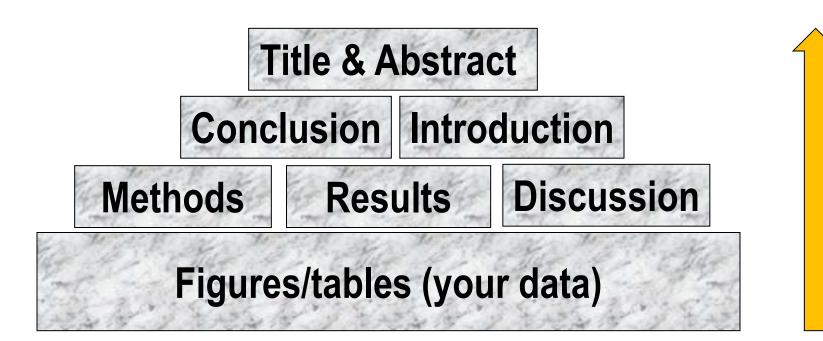

- Write direct and <u>short</u> sentences
- <u>One idea</u> or piece of information <u>per</u> <u>sentence</u> is sufficient
- <u>Avoid</u> multiple statements in one sentence

An example of what <u>NOT</u> to do:

"If it is the case, intravenous administration should result in that emulsion has higher intravenous administration retention concentration, but which is not in accordance with the result, and therefore the more rational interpretation should be that SLN with mean diameter of 46nm is greatly different from emulsion with mean diameter of 65 nm in entering tumor, namely, it is probably difficult for emulsion to enter and exit from tumor blood vessel as freely as SLN, which may be caused by the fact that the tumor blood vessel aperture is smaller."

Tip: The process of writing – building the article

Authorship

- Policies regarding authorship can vary
- One example: the International Committee of Medical Journal Editors ("Vancouver Group") declared that an author must:
 - 1. **substantially contribute** to conception and design, or acquisition of data, or analysis and interpretation of data;
 - 2. draft the article or revise it critically for important intellectual content; and
 - 3. give their approval of the final full version to be published.
 - 4. <u>ALL three</u> conditions must be fulfilled to be an author!

All others would qualify as "Acknowledged Individuals"

Authorship - Order & Abuses

- General principles for who is listed first
 - First Author
 - Conducts and/or supervises the data generation and analysis and the proper presentation and interpretation of the results
 - Puts paper together and submits the paper to journal
 - <u>Corresponding author</u>
 - The first author or a senior author from the institution
 - Particularly when the first author is a PhD student or postdoc, and may move to another institution soon.
- Abuses to be avoided
 - <u>Ghost Authorship</u>: leaving out authors who should be included
 - <u>Gift Authorship</u>: including authors who did not contribute significantly

Recognize those who helped in the research, but do not qualify as authors (you want them to help again, don't you?)

Include individuals who have assisted you in your study:

Advisors

Financial supporters

Lab Technicians

Proofreaders/Typists

Suppliers who may have given materials

Author names: common problems

Different Spellings

- Järvinen / Jaervinen / Jarvinen
- Lueßen / Lueben / Luessen
- van Harten / Vanharten / Van
- First/Last Names
 - Asian names often difficult for Europeans or Americans
- What in case of marriage/divorce?

Be consistent!

If you are not, how can others be?

Title

 A good title should contain the fewest possible words that adequately describe the contents of a paper.

Effective titles

- Identify the main issue of the paper
- Begin with the subject of the paper
- Are accurate, unambiguous, specific, and complete
- Are as short as possible
- Articles with short, catchy titles are often better cited
- Do not contain rarely-used abbreviations
- Attract readers Remember: readers are the potential authors who will cite your article

Title: Examples

Original Title	Revised	Remarks
Preliminary observations on the effect of Zn element on anticorrosion of zinc plating layer	Effect of Zn on anticorrosion of zinc plating layer	Long title distracts readers. Remove all <u>redundancies</u> such as "observations on", "the nature of", etc.
Action of antibiotics on bacteria	Inhibition of growth of mycobacterium tuberculosis by streptomycin	Titles should be <u>specific</u> . Think to yourself: "How will I search for this piece of information?" when you design the title.
Fabrication of carbon/CdS coaxial nanofibers displaying optical and electrical properties via electrospinning carbon	Electrospinning of carbon/CdS coaxial nanofibers with optical and electrical properties	"English needs help. The title is nonsense. All materials have properties of all varieties. You could examine my hair for its electrical and optical properties! You MUST be specific. I haven't read the paper but I suspect there is something special about these properties, otherwise why would you be reporting them?" - the Editor-in-chief

Keywords

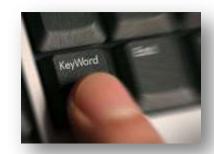

In an "electronic world, keywords determine whether your article is found or not!

Avoid making them

- too general ("drug delivery", "mouse", "disease", etc.)
- too narrow (so that nobody will ever search for it)

Effective approach:

Look at the keywords of articles relevant to your manuscript Play with these keywords, and see whether they return relevant papers, neither too many nor too few

Abstract

<u>Tell readers what you did and the important findings</u>

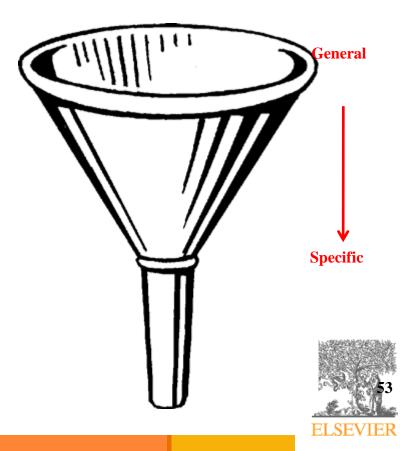

- One paragraph (between 50-250 words) often, plus Highlight bullet points
- Advertisement for your article
- A clear abstract will strongly influence if your work is considered further

Graphite intercalation compounds (GICs) of composition CxN(SO2CF3)2 · δF are prepared under ambient conditions in 48% hydrofluoric acid, using K2MnF6 as an oxidizing reagent. The stage 2 GIC product structures are determined using powder XRD and modeled by fitting one dimensional electron density profiles. A new digestion method followed by selective fluoride electrode elemental analyses allows the determination of free fluoride within products, and the compositional x and δ parameters are determined for reaction times from 0.25 500 h. What are the main findings

The place to convince readers that you know why your work is relevant, also for them

Answer a series of questions:

- What is the problem?
- Are there any existing solutions?
- Which one is the best?
- What is its main limitation?
- What do you hope to achieve?

Pay attention to the following

- Before you present your new data, put them into perspective first
- Be brief, it is <u>not</u> a history lesson
- Do not mix introduction, results, discussion and conclusions. Keep them separate
- Do not overuse expressions such as "novel", "first time", "first ever", "paradigm shift", etc.

Cite only <u>relevant</u> references

 Otherwise the editor and the reviewer may think you don't have a clue where you are writing about

Methods / Experimental

- Include all important details so that the reader can repeat the work.
 - Details that were previously published can be omitted but a general summary of those experiments should be included
- Give vendor names (and addresses) of equipment etc. used
- All chemicals must be identified
 - Do not use proprietary, unidentifiable compounds without description
- Present proper control experiments
- Avoid adding comments and discussion.
- Write in the past tense
 - Most journals prefer the passive voice, some the active.
- Consider use of Supplementary Materials
 - Documents, spreadsheets, audio, video,

Reviewers will criticize incomplete or incorrect descriptions, and may even recommend rejection

Ethics Committee approval

- Experiments on humans or animals must follow applicable ethics standards
 - e.g. most recent version of the Helsinki Declaration and/or relevant (local, national, international) animal experimentation guidelines
- Approval of the local ethics committee is required, and should be specified in the manuscript
- Editors can make their own decisions as to whether the experiments were done in an ethically acceptable manner
 - Sometimes local ethics approvals are way below internationally accepted standards

Results – what have you found?

- The following should be included
 - the main findings
 - Thus not all findings

- Findings from experiments described in the Methods section
- Highlight findings that differ from findings in previous publications, and unexpected findings
- Results of the statistical analysis

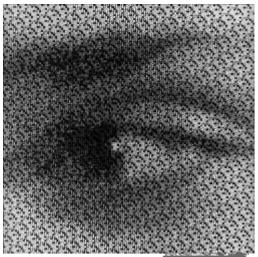

Results – Figures and tables

Illustrations are critical, because

- Figures and tables are the most efficient way to present results
- Results are the driving force of the publication
- Captions and legends must be detailed enough to make figures and tables self-explanatory
- No duplication of results described in text or other illustrations

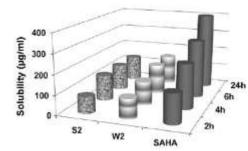

"One Picture is Worth a Thousand Words" Sue Hanauer (1968)

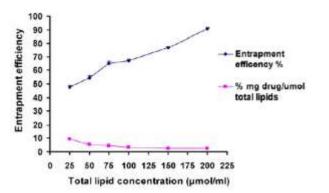

Results – Appearance counts!

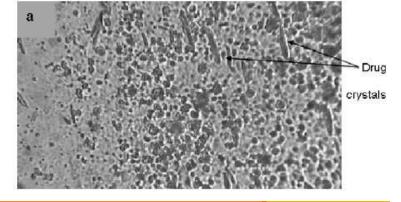

- Un-crowded plots
 - 3 or 4 data sets per figure; well-selected scales; appropriate axis label size; symbols clear to read; data sets easily distinguishable.
- Each photograph must have a scale marker of professional quality in a corner.
- Text in photos / figures in English
 - > Not in French, German, Chinese, Korean, ...
- Use color ONLY when necessary.
 - If different line styles can clarify the meaning, then never use colors or other thrilling effects.
- Color must be visible and distinguishable when printed in black & white.

• Do not include long boring tables!

59

Discussion – what do the results mean?

- It is the most important section of your article. Here you get the chance to SELL your data!
 - Many manuscripts are rejected because the Discussion is weak
- Check for the following:
 - How do your results relate to the original question or objectives outlined in the Introduction section?
 - Do you provide interpretation for each of your results presented?
 - Are your results consistent with what other investigators have reported? Or are there any differences? Why?
 - Are there any limitations?
 - Does the discussion logically lead to your conclusion?
- Do not
 - Make statements that go beyond what the results can support
 - Suddenly introduce new terms or ideas

Conclusions

- Present global and specific conclusions
- Indicate uses and extensions if appropriate
- Suggest future experiments and indicate whether they are underway
- Do not summarize the paper
 - The abstract is for that purpose
- Avoid judgments about impact

References: get them right!

- Please adhere to the Guide for Authors of the journal
- It is <u>your</u> responsibility, not of the Editor's, to format references correctly!
- Check
 - Referencing style of the journal
 - The spelling of author names, the year of publication
 - Punctuation use
 - Use of "et al.": "et al." translates to "and others",
- Avoid citing the following if possible:
 - Personal communications, unpublished observations, manuscripts not yet accepted for publication
 - Editors may ask for such documents for evaluation of the manuscripts
 - Articles published only in the local language, which are difficult for international readers to find

Supplementary Material

- Data of secondary importance for the main scientific thrust of the article
 - e.g. individual curves, when a representative curve or a mean curve is given in the article itself
- Or data that do not fit into the main body of the article
 - e.g. audio, video,
- Not part of the printed article
 - Will be available online with the published paper
- Must relate to, and support, the article

Typical mean length of a full article

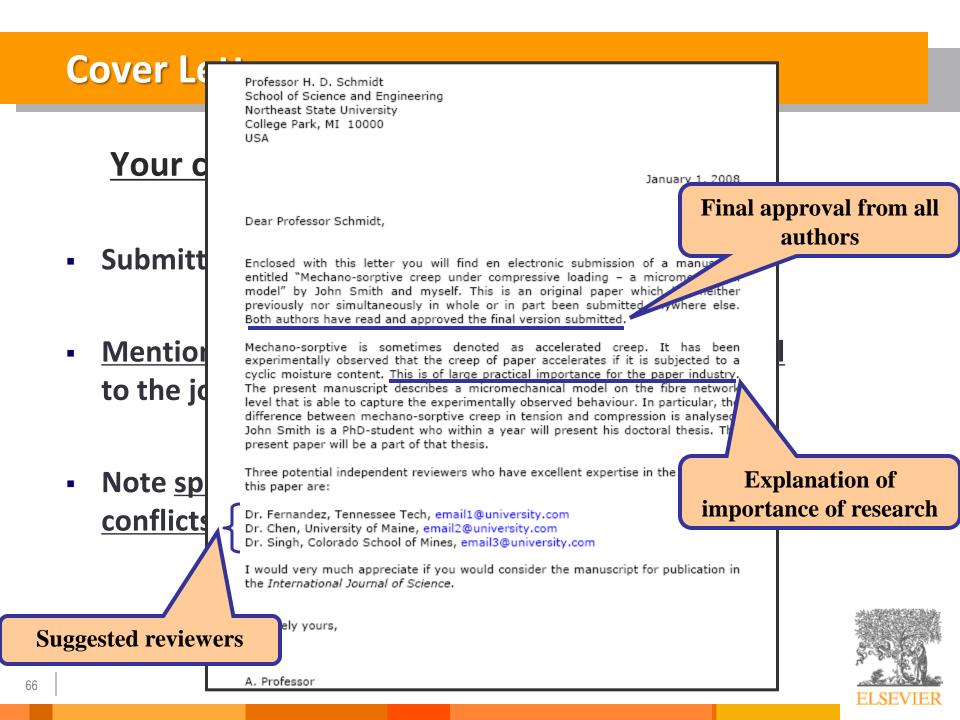

- Not the same for all journals, even in the same field
- "...25- 30 pages is the ideal length for a submitted manuscript, including ESSENTIAL data only."
 - Title page
 - Abstract
 1 paragraph
 - Introduction 1.5-2 manuscript pages (double-spaced, 12pt)
 - Methods
 2-4 manuscript pages
 - Results & Discussion 10-12 manuscript pages
 - Conclusions 1-2 manuscript pages
 - Figures 6-8
 - Tables 1-3
 - References 20-50
 - Letters or short communications usually have a stricter size limitation, e.g. 3,000 words and no more than 5 figures/tables.

Abbreviations

- Abbreviations must be defined on the first use in both abstract and main text.
- Some journals do not allow the use of abbreviations in the abstract.
- Abbreviations that are firmly established in the field do not need to be defined, e.g. DNA.
- Never define an abbreviation of a term that is only used once.
- Avoid acronyms, if possible
 - Abbreviations that consist of the initial letters of a series of words
 - Can be typical "lab jargon", incomprehensible to outsiders

Suggest potential reviewers

- Your suggestions will help the Editor to move your manuscript to the review stage more efficiently.
- You can easily find potential reviewers and their contact details from articles in your specific subject area (e.g., your references).
- The reviewers should represent at least two regions of the world. And they should not be your supervisor or close friends.
- Be prepared to suggest 3-6 potential reviewers, based on the Guide to Authors.

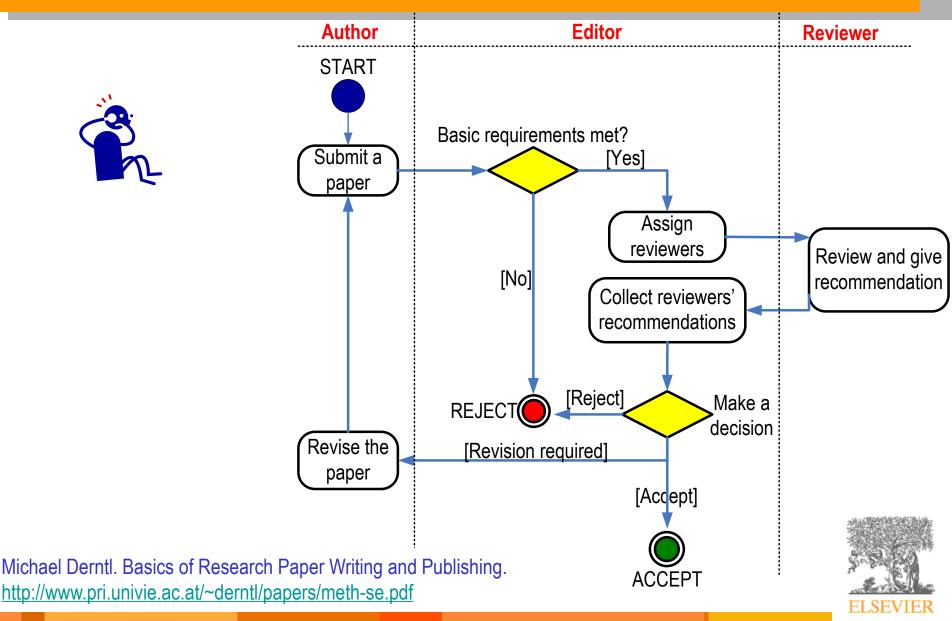

Do everything to make your submission a success

- No one gets it right the first time!
 - Write, and re-write
- Suggestions
 - After writing a first version, take several days of rest.
 Come back with a critical, fresh view.
 - Ask colleagues and supervisor to review your manuscript. Ask them to be highly critical, and *be open to their suggestions*.
 - Make changes to incorporate comments and suggestions. Get all co-authors to approve version to submit.

Then it is the point in time to submit your article!

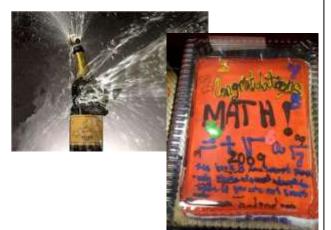

The Peer Review Process – not a black hole!

First Decision: "Accepted" or "Rejected"

Accepted

• Very rare, but it happens

Congratulations!

- Cake for the department
- Now wait for page proofs and then for your article to be online and in print

Rejected

- Probability 40-90% ...
- Do not despair
 - It happens to everybody

Try to understand WHY

- Consider reviewers' advice
- Be self-critical
- If you submit to another journal, begin as if it were a new manuscript
 - Take advantage of the reviewers' comments
 - They may review your manuscript for the other journal too!
 - Read the Guide for Authors of the new journal, again and again.

First Decision: "Major" or "Minor" Revision

Major revision

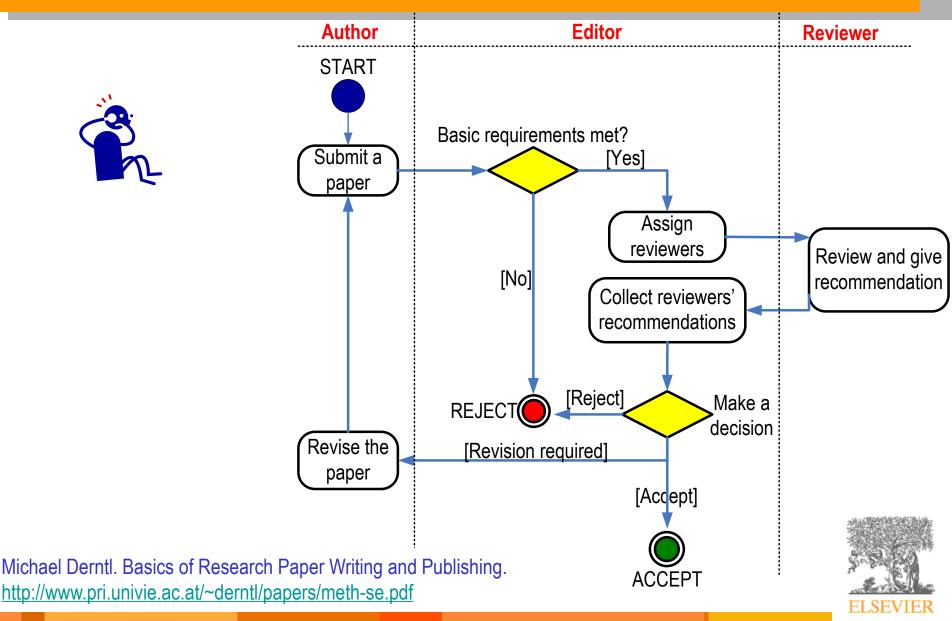

- The manuscript may finally be published in the journal
- Significant deficiencies must be corrected before acceptance
- Usually involves (significant) textual modifications and/or additional experiments

Minor revision

- Basically, the manuscript is worth being published
- Some elements in the manuscript must be clarified, restructured, shortened (often) or expanded (rarely)
- Textual adaptations
- "Minor revision" does NOT guarantee acceptance after revision!

The Peer Review Process – not a black hole!

Manuscript Revision

Prepare a detailed Response Letter

- Copy-paste <u>each</u> reviewer comment, and type your response below it
- State specifically which changes you have made to the manuscript
 - Include page/line numbers
 - No general statements like "Comment accepted, and Discussion changed accordingly."
- Provide a *scientific* response to comments to accept,
- or a convincing, solid and <u>polite</u> rebuttal when you feel the reviewer was wrong.
- Write in such a manner, that your response can be forwarded to the reviewer without prior editing

Do not do yourself a disfavour, but cherish your work

- You spent weeks and months in the lab or the library to do the research
- It took you weeks to write the manuscript......

.....Why then run the risk of avoidable rejection by not taking manuscript revision seriously?

Rejection: not the end of the world

- Everyone has papers rejected do not take it personally.
- You are allowed to get angry for a few minutes. Then move on!

- Try to understand why the paper was rejected and what you need to do to improve it.
- As you have received the benefit of the editor's and reviewers' time; take their advice seriously!
- Re-evaluate your work and decide whether it is appropriate to submit the paper elsewhere – perhaps to the next journal on your 'candidate journals' list.
- Be persistent!

Increasing the likelihood of acceptance

All these various steps are not difficult

You have to be consistent.

You have to check and recheck before submitting.

Make sure you tell a logical, clear, story about your findings.

Especially, take note of referees' comments.

This should increase the likelihood of your paper being accepted, and being in the 30% (accepted) not the 70% (rejected) group!

77

What leads to acceptance ?

- <u>Attention to details</u>
- <u>C</u>heck and double check your work
- <u>C</u>onsider the reviewers' comments
- <u>English must be as good as possible</u>
- <u>P</u>resentation is important
- <u>Take your time with revision</u>
- <u>A</u>cknowledge those who have helped you
- <u>N</u>ew, original and previously unpublished
- <u>C</u>ritically evaluate your own manuscript
- Ethical rules must be obeyed

– Nigel John Cook Editor-in-Chief, *Ore Geology Reviews*

When it comes to publishing ethics abuse, the much used phrase "Publish or Perish" has in reality become "Publish AND Perish"!

Ethics Issues in Publishing

Scientific misconduct

Falsification of results

Publication misconduct

- Plagiarism
 - Different forms / severities
 - The paper must be original to the authors
- Duplicate publication
- Duplicate submission
- Appropriate acknowledgement of prior research and researchers
- Appropriate identification of all co-authors
- Conflict of interest

Publish AND Perish! – if you break ethical rules

- International scientific ethics have evolved over centuries and are commonly held throughout the world.
- Scientific ethics are not considered to have national variants or characteristics – there is a *single ethical standard* for science.
- Ethics problems with scientific articles are on the rise globally.

M. Errami & H. Garner A tale of two citations Nature 451 (2008): 397-399

Plagiarism

- A short-cut to long-term consequences!
- Plagiarism is considered a serious offense by your institute, by journal editors, and by the scientific community.
- Plagiarism may result in *academic charges*, but will certainly cause rejection of your paper.
- Plagiarism will *hurt your reputation* in the scientific community.
 No Copying

Duplicate Publication

- Two or more papers, without full cross reference, share the same hypotheses, data, discussion points, or conclusions
- An author should not submit for consideration in another journal a previously published paper.
 - Published studies <u>do not need to be repeated</u> unless further confirmation is required.
 - Previous publication of an abstract during the proceedings of conferences does not preclude subsequent submission for publication, but <u>full disclosure</u> should be made at the time of submission.
 - Re-publication of a paper in another language is acceptable, provided that there is <u>full and prominent disclosure of its original source</u> at the time of submission.
 - At the time of submission, authors should disclose details of related papers, even if in a different language, and similar papers in press.
 - This includes translations

87

Plagiarism Detection Tools

- Elsevier is participating in 2 plagiarism detection schemes:
 - TurnItIn (aimed at universities)
 - IThenticate (aimed at publishers and corporations)

Manuscripts are checked against a database of over 32 million peer reviewed articles which have been donated by 50+ publishers, including Elsevier.

All post-1994 Elsevier journal content is now included, and the pre-1995 is being steadily added week-by-week

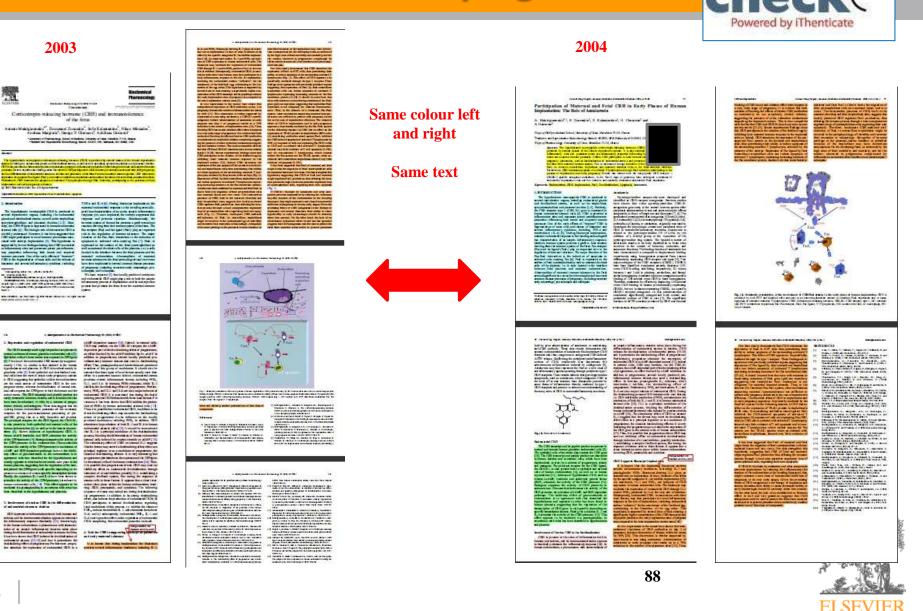

- Editors and reviewers
- Your colleagues
- "Other" whistleblowers
 - "The walls have ears", it seems ...

This article has been retracted at the request of the Editor-in-Chief and P http://www.elsevier.com/locate/withdrawalpolicy.

Reason: This article is virtually identical to the previously published article algorithm for SNR improvement in ultrasonic NDT", *Independent Nonde International*, volume 38 (2005) 453 – 458 authored by M. Ruiz Rever, F. the echoes issuing from the flaws to be detected. Therefore, it cannot be cancelled by classical time averaging or matched band-pass filtering techniques.

Many signal processing techniques have been utilized for signal-to-noise ratio (SNR) improvement in ultrasonic NDT of highly scattering materials. The most popular one is the split spectrum processing (SSP) [1-3], because it makes possible real-time ultrasonic test for industrial applications, providing quite good results. Alternatively to SSP, wavelet transform (WT) based denoising/detection methods have been proposed during recent years [4-8], yielding usually to higher improvements of SNR at the expense of an increase in complexity. Adaptive time-frequency analysis by basis pursuit (BP) [9,10] is a recent technique for decomposing a signal into an optimal superposition of elements in an overcomplete waveform dictionary. This technique and some other related techniques have been successfully applied to denoising ultrasonic signals co taminated with grain noise in highly scattering materials [11,12], as an alternative to the W technique, the computational cost of e BP algorithm being the main drawback

In this paper, we propose a used morning pursuit-based signal processing emethods for improving SNR in ultrascer. NDT 5' highly scattering materials, such a set and composites. Matching pussuit is used instead of BP to reduce the complexity. Description is iterate mature, the method is fast enough to be real-time implemented. The performance of the proposed method has been evaluated user both computer simulation and expressional real's, new when the input SNR (NRin) is lower than 0dB (the level of echoes particle and is introstructures is above the level of some choes).

2. Matching pursuit

Matching pursuit was introduced by Mailat and Zhang [13]. Let us suppose an approximation of the ultrasonic backscattered signals x[n] as a linear expansion in terms of functions $g_i[n]$ chosen from an over-complete dictionary. Let H be a Hilbert space. We define the over-complete dictionary as a family $D = \{g_i; i = 0, 1, ..., L\}$ of vectors in H, such as $||g_i|| = 1$.

The problem of choosing functions $g_i[n]$ that best approximate the analysed signal $g_i[n]$ is computationally very complex. Matching persuit is an iterative algorithm that offers sub-optimal solutions for decomposing signals in terms of expansion functions chosenerum a decomary, where \tilde{I} nom is used as the algorithm function metric because of its mathematical combination metric because of its mathematical combination of the algorithm leads to compact at leave when it models

In each size of the interfere procedure, vector $g_i[n]$ which give the largest oner product with the analysed signal is posen. The contribution of this vector when subtracted from the signal and the process is repeated on the residual. At the with intration the widdle is

$$m = 0$$
,
 $[n] + \alpha_{ijmijkinij}[n], \quad m \neq 0$,

(D)

(4)

where $\alpha_{(m)}$ is the weight associated to optimum atom $q_{(m)}[n]$ at the wth iteration.

(×[r

r"[n]

The weight d_i^{μ} associated to each atom $g_i[n] \in D$ at the *n*th iteration is introduced to compute all the inner products with the sestimat $r^{\mu}[n]$:

$$l_i^{\mu} = \frac{(r^{\mu}[\eta], g_i[\eta])}{(g_i[\eta], g_i[\eta])} = \frac{(r^{\mu}[\eta], g_i[\eta])^2}{\|g_i[\eta]\|^2}$$

= $k^{\mu}[\eta], g_i[\eta], q_i[\eta]).$ (2)

The optimum atom $g_{ijke}[n]$ (and its weight α_{ijke}) at the with iteration are obtained as follows:

$$g_{\ell m}[n] = \arg \min_{\mathbf{q} \in D} \| \boldsymbol{r}^{m+1}[n] \|^2$$

= $\arg \max_{\boldsymbol{a} \in D} \| \boldsymbol{a}^m_i \|^2 = \arg \max_{\boldsymbol{a} \in \mathcal{A}} \| \boldsymbol{a}^m_i \|.$ (3)

The computation of correlations $(r^{\alpha}[n], g_{i}[n])$ for all vectors $g_{i}[n]$ at each iteration implies a high computational effort, which can be substantially reduced using an updating procedure derived from Eq. (1). The correlation updating procedure [13] is performed as follows:

 $(r^{m+1}[n], g_i[n]) = (r^m[n], g_i[n])$

 $-\alpha_{int} \langle g_{int}[n], g_i[n] \rangle$.

German minister loses doctorate after plagiarism row

Germany's defence minister has been stripped of his university doctorate after he was found to have copied large parts of his work from others.

Karl-Theodor zu Guttenberg, an aristocraf who lives in a Bavarian castle, admitted breaching standards but denied deliberately cheating.

Analysis revealed that more than half of his thesis had long sections lifted word-for-word from the work of others.

So far the German Chancellor, Angela Merkel, has stood by the minister.

Mr Guttenberg failed to name sources for parts of his PhD thesis

Related Stories

The University of Bayreuth decided that Mr Guttenberg had "violated scientific duties to a considerable extent".

It deplored the fact that he had lifted sections of text without attribution.

Last week Mr Guttenberg said he would temporarily give up his PhD title while the university investigated the charges of plagiarism. He admitted that he had made "serious mistakes".

His thesis - Constitution and Constitutional Treaty. Constitutional Developments in the US and EU - was completed in 2006 and published in 2009.

Chancellor Merkel insisted on Monday that she was standing by her defence minister, who was seen as something of a rising star in her conservative coalition
